

**Hadzhiivanov, David D.A.**

Checkpoint 18 lwk8-Ben 31-10-2025**Hadzhiivanov, David D.A.** a day ago

We had a discussion with Ben reviewing my documentation and the outcome was very insightful.

We started with the Analysis document and although the structure is good Ben suggested that i remove or change some unnecessary things such as the MoSCoW list and changing my point about "System Requirements" to something more accurate such as "System Limitations". In the risk analysis i have to be more specific with some parts such as the "Insecure authentication" which is better described as "Database Security". On top of everything my agile methodology turned out to not be the most effective the way i wrote it and i missed the point of it so thats something that needs to be updated aswell. Lastly, at point 9 which is currently about non-functional requirements, the content is unnecessary and vague, its best to remove it.

We moved on to the Advice document and we mostly focused on the conclusion part which is very vague and doesnt really include anything that was discussed in the Advice document, so that needs more work.

The Design document was a bit more positive with a further focus on details rather than big changes. Ben's suggestion was to add a small description and sort of enumerate the images displayed to further clarify them for the reader. Additionally, when commenting on the Security and encryption design part of my document where i describe the way keys will be generated, i need to specify where they will be generated because it is an important detail, for example the keys will be generated on the server not the client so that needs clarification.

When it comes to the Realisation document, i have some things that are repeated from the design document and can be unnecessary or i can remove the file structure image from the design document and leave it in the realisation document, also when it comes to file structure i need to work on better names for the files displayed since some of the ones i used dont really describe what they are for. For the images the same thing from the design document applies so that needs work. Lastly when mentioning the point about Hosting and Deployment i explain some concepts used but dont provide visuals and additionally i only provide very surface level code images and Ben said that i could include some more interesting stuff from my code.

Talking about the validation, we mainly focused on the tests made to confirm that the application works correctly. What Ben rightfully suggested was that i make a connection between my goals and the tests so they reflect each other making more sense to the reader.

Not much was commented on the Reflection document so im going to assume that it is good enough for the current scope of the project.

Overall Ben's advice was very insightful and even if i dont implement all of the advice he gave me i will definitely consider it for the next project.

Write a summary of what you discussed with your teacher...

Post feedback

Checkpoint 17 Presentation 30-10-2025 🔒

Hadzhiivanov, David D.A. 2 days ago

Today I presented my passion project – a secure notepad-style web application focused on encryption and safe data handling. The presentation covered my project's journey, from the original idea of a desktop app to the final web-based version hosted on a Raspberry Pi. I explained how the project evolved through feedback from Xuemei and Ben, how I implemented HTTPS with Certbot, and how I handled encryption using a substitution method.

During the presentation, I showed a demo video of the app running securely with HTTPS and walked through the main functions — account creation, note management, and encryption/decryption. The feedback from Petra and the class was positive, highlighting the clear explanation and the technical depth of my work.

Petra had some advice for me and it was to make the app simpler to use for the user and other design changes, which i will definitely consider next project.

This experience helped me improve my public speaking and structure my thoughts clearly under pressure. It also gave me confidence in presenting technical projects to a larger audience and explaining complex cybersecurity concepts in a simple, understandable way.

Checkpoint 16 Week 8 CW: Minilecture on website hosting 29-10-2025 **Hadzhiivanov, David D.A.** 3 days ago

With Ceryl we had a discussion about how we can host our websites.

Ceryl's mini-lecture helped guide me towards how i should host my python website and further clarified how hosting a website through cloud services works.

The solution to how i should host my python website is to host it on my raspberry pi which i got earlier during the project development and set up https on there manually.

After the mini-lecture i came to Ceryl to help me with setting up my nginx and web application because i had problems doing it myself. With his help we set up the nginx connection to the ports i have opened up myself to allow for an http connection. When deploying the app we encountered problems with the database but they were easily resolved because of the expert knowledge Ceryl possesses.

Now that my web app is working and i saw the ins and outs of making it work i am going to configure the https protocols.

Checkpoint 15 lwk7-Ben 24-10-2025 **Hadzhiivanov, David D.A.** 8 days ago

Today i asked Mr Ben for some advice and feedback on my project.

First i showed my current progress and told him my vision and we discussed different ideas and he guided me towards several solutions.

My vision is that on my web app i want to safely encrypt and decrypt my messages by not letting the server know how to decrypt my information. This way if a hacker gets access to the database of the server where the messages and accounts are stored they cannot decrypt the messages since the keys will be stored securely somewhere else.

What Ben suggested was that i use my raspberry pi to encrypt and decrypt my messages and that way the server will not have access to the keys for decryption. This was the idea i liked the most and would love to implement in my project. The other idea was to generate a private key and based on it generate a public key and then with it a signature for whatever message i would like to decrypt, afterwards for decryption i need to provide the public key so that the server can verify that i am actually the owner of the message. But for me thats a little complicated for the user and so it can become a hassle to remember and save public keys and signatures to decrypt their messages.

This is my goal now and hopefully i will be able to implement it successfully.

Checkpoint 14 W7: Xuemei 21-10-2025

 You didn't submit feedback for this checkpoint.

Checkpoint 13 Week 6 CW: Programming session databases 08-10-2025

 You didn't submit feedback for this checkpoint.

Checkpoint 12 W6: Xuemei 07-10-2025 **Hadzhiivanov, David D.A.** 25 days ago

Today I met with Miss Xuemei to discuss my passion project and received valuable feedback on my progress and next steps. We began by reviewing her recent comments on my project proposal, where she advised me to shift the focus from a desktop application to a web-based app in order to apply more cybersecurity principles in practice.

She recommended that I work with HTTPS protocols and SSL/TLS certificates, and implement AES or RSA encryption for securing user login details. Additionally, she suggested I integrate a database to manage and store user credentials securely.

Miss Xuemei mentioned that I could host my project using Netlab's infrastructure, but I plan to first experiment with deployment on my Raspberry Pi to gain hands-on experience, and later transition to Netlab for the final hosting stage.

By the end of our discussion, I had a clear direction for my next steps:

1. Develop the web-based version of the application.
2. Implement secure user authentication and hashed storage for login data.
3. Add HTTPS and SSL/TLS protocols for encrypted communication.
4. Host the final version of the website on a secure server environment.

Most importantly, i need to update my proposal so that it matches my current goals.

Checkpoint 11 lwk5-Ben 03-10-2025 **Hadzhiivanov, David D.A.** a month ago

I showed Ben the passion project i am making and he gave me a challenge which will help with the security aspect of my project.

My passion project: A notepad application where the user can input text, save it, encrypt it and decrypt it later for redaction or readability.

The challenge he gave me is to think of a secure environment where the key to encryption can be saved instead of it being saved locally on the computer.

I will work on it and see what i can do.

Checkpoint 10 Amália 01-10-2025 **Hadzhiivanov, David D.A.** a month ago

Today i talked with miss Amalia about my passion project and seek approval. We discussed what the project i want to make is, my goals and the knowledge i will learn.

My passion project: A notepad application where the user can input text, save it, encrypt it and decrypt it later for redaction or readability.

The must haves we discussed are:

- The user can type text
- Save the file
- It gets encrypted
- Be able to decrypt it later

My goal now is to finish my analysis to set my priorities straight and research encryption methods to see which one im going to use in my project.

Checkpoint 9 Pitch presentation 25-09-2025 **Hadzhiivanov, David D.A.** a month ago

Today in the presence of miss Petra i made a presentation of my game in front of my class and demonstrated its functionality. The goal of this exercise was to gain feedback on our games.

I additionally got the chance to practice my presenting skills which is valuable for the professional learning outcome.

Checkpoint 8 W4: peer review your game (Xuemei) 23-09-2025 **Hadzhiivanov, David D.A.** a month ago

On this day with miss Xuemei i got a chance to get valuable feedback through peer reviews. I got a lot of insight on ideas i could implement such as visual improvements or more features.

The peer review exercise was very helpful and definitely helped me get an objective view of my project.

Checkpoint 7 Feedback with Petra 18-09-2025 **Hadzhiivanov, David D.A.** a month ago

Today with miss Petra we discussed my ideas about the portfolio and some improvements i could make.

I showed her my Analysis and Design documents along with my flowcharts and she suggested to me how i can implement them in my portfolio. She gave me some additional advice on how i should structure it so it is easy to read. The examples of some portfolios she gave me were very useful and gave me a lot of insights, so im definitely going to implement some of them.

I also showed her my first working prototype of my game and she gave me suggestions on how i can improve the UI to make it more clear to the user and help them understand what needs to be done. This is what i am going to work on week 4 if i find enough time.

Checkpoint 6 Amália 17-09-2025 **Hadzhiivanov, David D.A.** a month ago

Today with miss Amalia we talked about my current progress and improvements i have made along the way, also we discussed the documentation which i am currently working on diligently and exchanged some suggestions on how to polish everything.

In the beginning i showed miss Amalia my analysis document and my design document which is currently in progress. Additionally i showed her a preview of the contents of the design document which consisted of user journey diagrams, flowcharts and images of the different game phases.

At the end i showed her my first finished prototype of the game and the improvements suggested from our last session. She gave me approval that the current state of the game can be considered as finished and that i can add more features for it if time allows. One suggestion was that i add a "Help" button in the game which will clearly and simply describe the game rules. By showing her my code i also pointed out the way i have organised it and made everything clearer for the future reader since it will be included in my documentation, the addition of comments make every part of the code stand out and helps the reader understand each line and feature.

Ultimately she suggested i put in my documentation explanations on how i reached a certain point, how i found bugs and fixed them, in addition to the sources i used to learn some kind of information connected to my project and all of the tools implemented in the game.

My next goal is to finish the documentation and create a final iteration of the game in a web-browser environment using Flask, in result creating the final document necessary to make the entire project complete - the finalization and testing.

Checkpoint 5 Amália 10-09-2025 **Hadzhiivanov, David D.A.** 2 months ago

Today with miss Amalia we talked about my current progress and improvements in the project and also about my plans and some suggestions that can be implemented in the project.

I showed miss Amalia my analysis, and she had no complaints about it. Afterwards i let her review my code for the game im making and the visuals i have implemented. I have progressed from last time, figuring out how to make the letters appear on screen, how to input a word that has to be then guessed and how it is going to appear for everyone once the user has finally decided on what the word is going to be. I showed that i have also started working on a clock mechanic that will count down time limiting the time needed to make a guess.

Miss Amalia gave me some useful suggestions about the visuals of the game and some mechanics involved. She mentioned that i should make the text bigger so that it is easier to read from further away, additionally she suggested that when it comes to the guessing mechanic, once a letter has been guessed and it is correct it will be drawn independently on the screen in the position of the original letter. Upon a wrong guess she also advised me to show the wrongly guessed letter on the screen so that the users don't get confused on what they have already tried and what they have not.

I told her a possible method on making the hangman appear so that on every mistake the appropriate part pops up and she approved my idea of making an array of some sorts with all of the hangman parts and based on that make a for or an if statement that adds the appropriate part.

Lastly i mentioned the idea that miss Xuemei gave me to make it a web based game using the code that i have already made on Python and just use Flask to implement it. This is definitely one of my goals from now on.

Checkpoint 4 W2: Feedback (Xuemei) 09-09-2025 **Hadzhiivanov, David D.A.** 2 months ago

Today i asked miss Xuemei for feedback on my analysis and i got some pretty useful info and regards on what is necessary in it at this stage and what is not.

I showed her my portfolio and current progress on my project, such as my code, and asked her how i can include a cybersecurity element to it because of my desire to pursue a career in cybersecurity. Her advice was to use Flask and make it a web environment, from there i can host it on a server and maybe work on the https protocols and take the necessary security measures.

Her advice was very useful and helped guide me towards my goal.

Checkpoint 3 Feedback with Petra 04-09-2025 **Hadzhiivanov, David D.A.** 2 months ago

Today i talked with Miss Petra about my portfolio and any improvements I can make.

I asked her about advice on the contents of each of the goals on the portfolio page and she said that i can copy previous evidences except that i have to mention why they belong in the specific goal. I took her advice and did that for all of my evidences and after further feedback she told me that i am doing great and to keep adding evidences as i go along with my project.

She also explained to me the purpose of the "Collection Description" and what i could put in it to make my portfolio stand out. She mentioned that i could use it as a log where i could put my progress as it goes along following the preset guide that is pre-written, or i could use it as a reading guide to make reading and understanding of my portfolio easier.

I had big progress with my understanding on how the portfolio works and how i should structure it thanks to Miss Petra, so today was very productive.

Checkpoint 2 Amália 03-09-2025 **Hadzhiivanov, David D.A.** 2 months ago

Today i talked with Amalia about my progress and gave me suggestions that i can use to develop my game. The game i have chosen to work on is Hangman.

In the beginning i began showing her my progress which included my code and the visuals of how the game is turning out. I am still at the beginning stages where i have only made small background changes and drawn some shapes. I also showed her the open source library i am using to create the project, it is called Pygame and works in Python.

Miss Amalia saw my progress and said that i was on the right track and i should continue what i am doing. I mentioned to her that i intended to draw a diagram of the processes that will partake in the game, and she told me that it was a good idea for me to do that and that it may also guide me through the process, it will also sit good in my portfolio.

When it comes to the portfolio, we talked about how i can implement my thought processes and decisions leading to my choices of games and programming languages that i am going to do and use, which i have written on a notepad as personal documentation.

Lastly we discussed what the next steps would be of the game's development. She told me that maybe i could work on how inputting the words will work, one of her ideas was that the word's string can be split so that each letter gains an identifier and i can use that to decide whether the inputted letter is correct or wrong. She also mentioned that i can add some clock to the game so that there is a time limit in between decisions. All ideas are good ones and i will begin research on how to implement them.

My next goal is to learn about inputting words and interaction with the game interface.

Checkpoint 1 W1: intro your interests & project ideas (Xuemei) 02-09-2025 😊**Hadzhiivanov, David D.A.** 2 months ago

Today i decided what game i should attempt making. The game will be Plinko Balls, it is about the player giving input by clicking a button on the keyboard or a virtual button on the screen which in turn will make balls drop in a triangle shaped space with stationary pins in between to scatter the balls in random directions left or right. Depending on how far the balls land from the center of the bottom of the triangle the player gets points. The further away from the center will equal to more points earned.

The programming languages i intend on using are HTML, CSS, and Python. I will begin research to learn these languages and figuring out how i can implement them into my project.
